EVERFOX IN ACTION

Securing Interoperability for Mission Advantage

How MindLink and Everfox Empower Real-Time, Trusted Communication Across Sovereign, Mission, and Coalition Partners

Teams today operate in fast-moving, contested environments where decisions rely on trusted information moving securely at speed. Everfox and MindLink deliver more than connectivity.

They enable commanders, units, and mission partners to share the right data at the right time, across security boundaries, without compromising control.

Modernization is not just a technology upgrade. It is a readiness imperative. By building a secure digital communications foundation, organizations improve operational tempo, strengthen interoperability, and prepare for future demands.

THE MISSION:

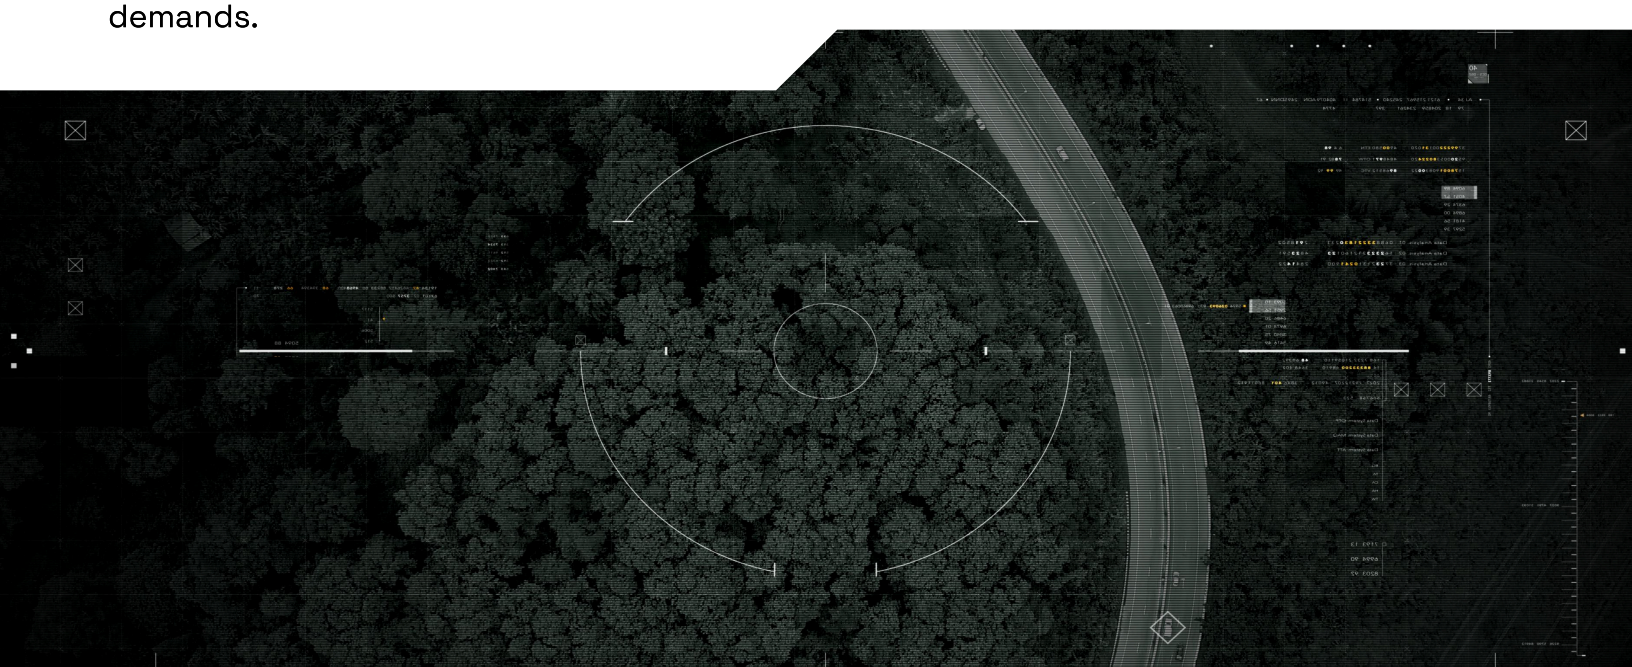

MindLink and Everfox set out to modernize secure communications across sovereign networks, mission environments, and coalition partners.

The goal: to create a trusted digital backbone that supports faster decisions, improves collaboration, and protects sensitive information across classification levels.

THE CHALLENGE:

Different chat apps, standards, and protocols make Cross Domain communication tough. Sovereign, mission secret, and coalition networks all operate in silos. Without a trusted way to bridge these environments, conversations stall or break down.

Legacy systems and manual workflows slow decision-making, reduce situational awareness, and create risk for mission teams that need timely, trusted data. Information must move securely between partners while preserving policy controls, protecting sensitive data, and maintaining operational trust. Without modernization, organizations risk losing tempo, efficiency, and operational advantage.

THE RESULT:

MindLink and Everfox achieved secure, real-time interoperability during the European exercise. Trusted communication was enabled across sovereign, mission secret, and coalition domains, supporting operational needs at the tactical edge and within enterprise environments.

Through collaboration and integration, secure Cross Domain information flow is enabling:

- Secure federation between sovereign users and mission secret users across domain boundaries
- Trusted separation between sovereign and mission networks, allowing seamless conversation
- Messages flowing from one tactical network to another, even when networks operate at different classifications or belong to coalition partners
- Onward connectivity into wider environments, including the jChat community through XMPP, allowing different systems to communicate as part of a broader operational ecosystem

Everfox and Mindlink helped to enable:

- Secure data exchange across domains
- Reliable communication between organizations
- Greater visibility and faster decision-making at the tactical edge

THE IMPACT:

With secure chat at mission speed, teams collaborate in real time across Cross Domain environments. Coordination sharpens, decisions accelerate, friction vanishes. The MindLink x Everfox integration proves that trusted Cross Domain communication supercharges operational effectiveness, getting the right information to the right people, exactly when it matters.

Everfox empowers defense and government organizations to move trusted data wherever it needs to go, protect it at every stage, and unlock secure collaboration across mission partners, networks, and security domains.

About MindLink

MindLink® is a trusted secure mission information sharing platform for organisations and their mission partners to establish a global communication backbone and advance mission execution.

EVERFOX

Contact Everfox to build a communications environment that boosts readiness, strengthens teamwork, and gives your force the edge.
